But in this case, because we're passing a value we use @Binding

```
struct SecondView: View {

    @Binding var color: Color

    var body: some View {
        VStack {
            Circle()
                .foregroundStyle(color)
        }
    }
}
```

This is how @State and @Binding works
